

The Tutte Polynomial of the Truncated Icosahedron

David Pearce Victoria University of Wellington
Gary Haggard Bucknell University

April 6, 2010

Introduction

The truncated icosahedron (TI) has always been an elusive target for the computation of its chromatic, flow, reliability, and Tutte polynomials. In [3] a hand computation of its chromatic polynomial was announced. It was not until [2] that an effective algorithm was implemented so that this chromatic polynomial computation could be replicated by a computer implemented algorithm. The computation of the Tutte polynomial of this graph is just now possible because of the work described in [1]. The Tutte polynomial is denoted as $T(G, x, y)$ for a graph G . $T(TI, x, y)$ has 660 terms. The largest coefficient is of size 10^{19} and belongs to the term

$$900942500549648668x^2 * y^{12}.$$

$T(TI, 0, 1) = 11551226205884 = T(TI, 1, 0)$ as expected for planar graphs. The number of spanning trees in TI is

$$T(TI, 1, 1) = 375391866372898816000.$$

We have

$$T(TI, 2, 2) = 1237940039285380274899124224 = 2^{90}.$$

The Tutte polynomial reduces to the one-variable chromatic, flow, and reliability polynomials. The algorithm for computing Tutte polynomials has been adapted to compute these one-variable polynomials directly. The code for each of these algorithms and the complete Tutte polynomial for the TI are found at homepages.mcs.vuw.ac.nz/~djp/tutte/.

$$T(TI, x, y)$$

```
